

Beta flask Server set-up

- The EKS
- And go in **Add Cluster** and choose the **Create** Option.
- Inside the **Configure Cluster** fill the all Column.

Name : beta-flask

Kubernetes version : 1.25

Cluster service role : kubernetes role

After No Changes

Choose the **Next** option.

Specify networking page

Networking

- Choose **vpc, subnet, security group**.

Choose cluster IP address family

- IPv4

Cluster endpoint access

- Public

Choose the **Next** option.

Configure logging

Control plane logging

- API Server
 - Audit
 - authenticator
 - Controller manager
 - scheduler
- (NOTE:- Choose all options)

Choose the **Next** option.

Select add-ons

- Here No Changes

Choose the **Next** option.

Review and create

No changes Here

Choose the **Next** option.

(Wait and See, Cluster info **Status** becomes **Active**)

Cluster is ready

After That go **Compute** Options, just below the **Cluster Status**.

- Choose the **Add node group**

Configure node group

- Fill all column

Name

Node IAM role

Kubernetes label

Tag (NOTE:- tag change)

Choose the **Next** option.

(Wait and See, Cluster info **Status** becomes **Active**)

After that go on EC2-Instance and connect your Server with command

`sudo aws eks --region us-east-2 update-kubeconfig --name pepkor-flask`

Check the pods with command

`kubectl get pods`

After that run below command

1. `cd /home/ubuntu/pintu/beta/`
2. `sudo kubectl apply -f beta_aws_flask.yaml`
3. `sudo kubectl apply -f app-deploy-svc.yaml`
4. `sudo kubectl get pods -n beta-service`

PyCharm

Repository:- retailigence-deployment

Branch :- beta-aws-flask

Folder :- http-domain-setup

Readme.md

5. `Kubectl get pods -n cert-manager`
6. `cd /retailigence-deployment`
7. `cd /http-domain-setup`
8. `git status`
9. `Sudo kubectl apply -f cert-manager.yaml`
10. `Kubectl -n cert-manager get all`
11. `Kubectl -n cert-manager get pods`
12. `Helm repo add ingress-nginx https://kubernetes.github.io/ingress-nginx`
13. `helm repo update`
14. `helm install app-ingress ingress-nginx/ingress-nginx --namespace ingress-nginx --create-namespace --set controller.replicaCount=2 --set controller.nodeSelector."beta\.kubernetes\.io/os"=linux --set defaultBackend.nodeSelector."beta\.kubernetes\.io/os"=linux`
15. `kubectl get services --namespace ingress-nginx`
16. `kubectl get all --namespace ingress-nginx`
17. `kubectl get pods --namespace ingress-nginx`
18. `kubectl apply -f cert-issuer-nginx-ingress.yaml`
19. `kubectl describe clusterissuer letsencrypt-cluster-issuer`

Pycharm

Service.yaml (pepkor convert to beta)

Note:- (pull on local terminal)

C:\users\admin\retailigence_deployment> (Path)

> git status

> git add .

> git commit -m "pepkor convert with beta"

> git pull origin beta-aws-flask

> git push origin beta-aws-flask

EC2- Terminal

20. cd /home/ubuntu/pintu/retailigence_deployment/https-domain-setup/

21. git status

22. git pull origin beta-aws-flask

23. Sudo kubectl apply -f service.yaml

Add C-name (Godaddy)

24. kubectl apply -f certificate.yaml

25. kubectl describe certificate example-app -n beta-service

26. kubectl get secrets -n beta-service

27. kubectl apply -f ingress.yaml
